

Applicant : Stuart A. Lipton
Serial No. : 08/346,910
Filed : November 30, 1994
Page : 3 of 5

Attorney's Docket No.: 08262-017004

In the specification:

Insert the paper copy of the Sequence Listing filed herewith following the Oath/Declaration.

Please replace the paragraph beginning at page 8, line 29 with the following rewritten paragraph:

Rescreening of the brain library with the 500 base clone identified two two kilobase (clones TR2A and TR2B (now accession number ATCC 97525) (SEQ. ID. NO.:1)) and three three kilobase (clones TR3A, TR3B, and TR3C) clones to which the 500 base clone hybridized. The mRNA detected on Northern blots with clone 68075_{DNA} is 6 kb in size. However, much of it, may consist of nontranslated sequences. In Western blots, 30-60 kDa bands were detected, suggesting that 68075 requires only about two kilobases to encode the full length protein.
